TITLE: Symposium on molecular structure and spectroscopy

PERIODICAL: Akademiya nauk SSSR. Vestnik, no. 3, 1963, 118-119

TEXT: This is a brief report on the Simpozium po molekuljarnoy strukture i spektroskopii (Symposium on Molecular Structure and Spectroscopy) which took place in Tokyo from Sept. 10 to 15, 1962. The Symposium was attended by 900 scientists, among them 700 from Japan and about 200 from 25 other countries. The USSR was represented by V. N. Kondrat'yev, member of the Ispolnitel'nyy komitet Mezhdunarodnogo soyuza teoreticheskoy i prikladnoy khimii (Executive Committee of the International Union for Theoretical and Applied Chemistry) and by the authors of this paper. More than 250 lectures were delivered.

TITLE: The broadening of spectral lines showing the linear Stark effect in plasma

PERIODICAL: Doklady Akademii nauk BSSR, v. 7, no. 3, 1963, 157 - 159

TEXT: The contour of spectral lines in plasma originating by broadening due to the linear Stark effect, which was previously calculated by J. Holtsmark (Phys. Zs., v. 20, 162, 1919), is defined more accurately in this paper. In the plasma, quasi-state electric fields from 0 to ∞ with the distribution probability $W(F) dF = \frac{1}{F_0} W(\beta) d\beta$ can arise, where $\beta = F/F_0$ and $F_0 = 2.61 \text{ eN}^{2/3}$ - the normal intensity of the field. The general half-width of the line was found to be

$$\gamma = 2 \Delta v_{1/2} = 2 a \beta_{1/2} F_0 = 2.80 a F_0 = 7.31 \text{ acN}^{4/3}, \quad (10)$$

where $\beta_{1/2}$, which determines the frequency shift $v_{1/2}$, is 1.40, a is the con-

TITLE: Application of the quadratic Stark effect in the determination of concentration of charged particles in plasma by the spectral line broadening of lithium and sodium

SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 3, 1965, 201-208

TOPIC TAGS: Stark effect, line broadening, charged particle concentration, lithium, sodium

ABSTRACT: Stark constants for the quadratic Stark effect for the sharp, principal, and diffuse lines of lithium and sodium were calculated. The calculation was based on the well known second order perturbation theory expression for energy level displacement of one-electron systems subject to an electric field

Card 1/4

UDC: 543.42

09010721

L 5447-66

ACC NR: AP5025085

$$C_{L,L} = \frac{e^4}{h} \sum_{n'} \left\{ \frac{[(L+1)^2 - M_L^2](n, L|r|n', L+1)^2 (L^2 - M_L^2)(n, L|r|n', L-1)^2}{4(L+1)^2 - 1} + \frac{4L^2 - 1}{E_{n,L} - E_{n',L+1}} \right\}$$

The results of calculation are given in tabular form. The effect of electron and ion impacts on the spectral line shape was determined by the use of the nonstationary electron impact theory and the Holtsmark theory respectively. It was found that the overall half-line width was almost equal to the sum of the half-line width due to electronic and ionic effects respectively. It is concluded that the quadratic Stark effect becomes noticeable for different lines at different charged particle concentrations, that a particular line may disappear completely at sufficiently high charged particle concentration, and that the diffuse series lines and the higher members of the sharp series are particularly sensitive to charged particles concentrations (see Fig. 1). The concentration of charged particles in a dc arc was calculated and compared with data reported by L. I. Grechikhin (Opt i spektr., 13, 578, 1962). The calculated values are in good agreement with experimental data.

TITLE: Development of a thermal explosion in time

SOURCE: AN BSSR. Doklady, v. 9, no. 12, 1965, 794-797

TOPIC TAGS: chemical explosion, heat conduction, activation energy

ABSTRACT: The article considers the one dimensional unsteady state limiting problem of the heat conduction equation:

$$\rho C_p \frac{\partial T}{\partial t} = \lambda \frac{\partial^2 T}{\partial x^2} + Q \exp\left(-\frac{E}{T}\right) \quad (1)$$

over the segment $-l \leq x \leq l$. Here, ρ is the density; C_p is the heat capacity at constant pressure; λ is the heat conductivity coefficient; $Q \exp(-E/T)$ is a function of the heat source for a reaction of "zero" order, obeying the Arrhenius law; E is the activation energy, expressed in degrees; and, T is the temperature. The following dimensionless variables

Card 1/2

L 15955-66

ACC NR: AP6002390

$$\tau = \frac{\lambda}{\rho C_p F} t, \xi = \frac{x}{l}$$

and the parameter

$$q = \frac{PQE}{\lambda T_0^2} \exp\left(-\frac{E}{T_0}\right).$$

are substituted into Eq. 1. Results of the mathematical solution developed in the article show that the calculated results agree satisfactorily with experiment only starting with $q > 2$. The critical value of the parameter q is determined by the condition $\Delta = 0$, which gives $q_{cr} = 0.895$. It is noted, finally, that at

$$\ll \frac{0.533}{V|\Delta|} \quad \text{for any given value of } q, \quad f(t) = 1.25q\tau.$$

This simple solution can easily be extended to reactions of zero order and to regions of more complicated geometry. "The author thanks S. I. Anisimov for suggesting the problem and for his direction of the work." Orig. art. has: 15 formulas, 1 figure, and 1 table.

TITLE: The effects of intense light beams on metals

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 7, 1273-1284

TOPIC TAGS: laser effect, metal melting, metal vaporizing, heat of sublimation

ABSTRACT: The authors have investigated theoretically and experimentally the phenomena accompanying the disruption of metals by focused laser beams. In the present paper there is considered the case of a laser producing approximately 1 millisecond pulses, each consisting of a sequence of approximately 1 microsecond spikes. The phenomena accompanying disruption of metals by giant laser pulses will be discussed in a future paper. In the theoretical part of the paper, fluxes of 10^{12} to 10^{16} erg/cm² sec on an approximately 1 mm diameter spot are considered. It is shown that under these conditions the transport of energy in the metal by heat conduction during the duration of a spike is negligible, and the problem of the vaporization of the metal is accordingly treated in one dimension. Formulas are derived, and curves are presented for different metals, relating the energy flux in the laser beam, the temperature of the metal surface, the erosion rate of the metal surface (i.e., the rate of increase

Card 1/3

L 40385-66

ACC NR: AP6025256

in the depth of the hole), and the velocity and pressure of the jet of metal vapor. The temperature of the metal surface is not equal to the boiling temperature, as was erroneously assumed by J.F. Ready (J. Appl. Phys., 36, No. 2, 462, 1965). The theoretical relations were tested by experiments on some 16 metals and alloys, using neodymium glass lasers producing up to 300 J pulses. The laser beam was focused with a lens onto the parallelepipedonical specimen and the disruptive process was recorded cinematographically at 10^5 frames per sec. In most of the experiments a glass plate was cemented to one face of the specimen and the laser beam was so directed parallel to the glass-metal boundary that about half of the beam passed freely through the glass and the other half penetrated into the metal, vaporizing it. In those experiments the process was photographed through the glass. The mass of metal removed by the laser pulse was determined by weighing the specimen, and the impulse due to reaction of the metal vapor jet was measured. The experiments were in qualitative agreement with the theory, and quantitative agreement in order of magnitude was found. The authors feel that development of a more accurate theory would not be worthwhile, owing to the large variations between different lasers. Three stages were distinguished in the disruption process: in the first stage the temperature of the metal surface increased at the rate of approximately 10^{10} degree/sec; in the second stage metal was vaporized from the specimen and a hole was formed in it; and in the third stage a pressure of 10^2 to 10^3 atmospheres developed within the hole and a powerful jet of metal vapor issued from it at supersonic velocities. The ratio of the laser pulse energy to the mass of metal

Card 2/3

L 40385-66

ACC NR: AP6025256

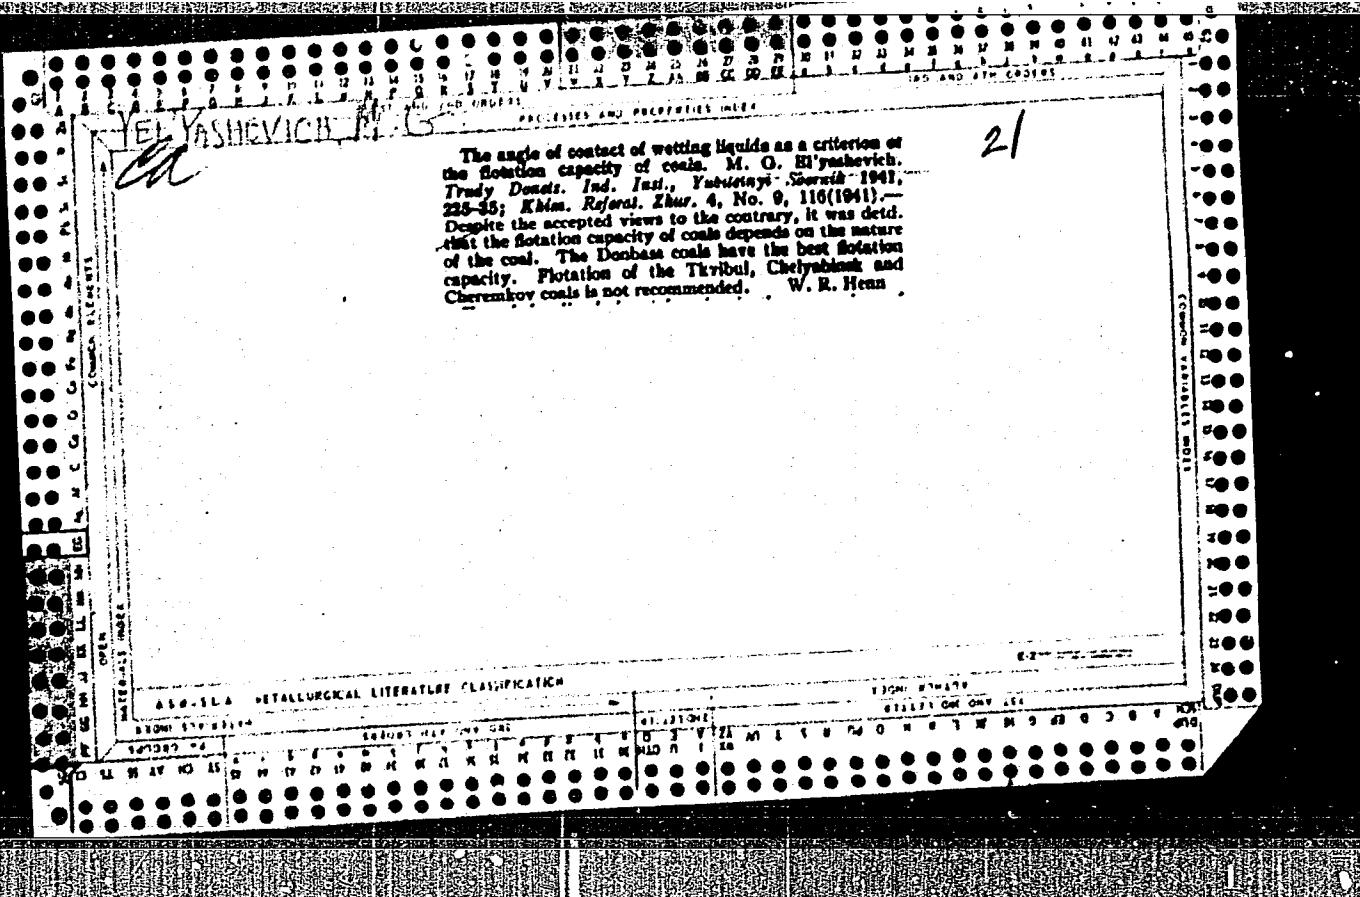

lost by the specimen was approximately equal to, but in most cases somewhat less than, the heat of sublimation of the metal. An appreciable mass of the metal was ejected as liquid. Orig. art. has: 9 formulas, 9 figures, and 2 tables. [15]

Spravochnik po televizionnym priyemnikam (Manual on Television Receivers)
Moscow, Gosenergoizdat, 1958. 175 p. 50,000 copies printed.

Ed.: Bardakh, I. M.; Tech. Ed.: Voronin, K. P.

PURPOSE: This handbook is addressed to radio amateurs, radio technicians, to
students enrolled in vtuzes and to designer.

COVERAGE: This handbook provides data on circuit diagrams, descriptions,
voltage charts, coil winding data, etc., on television receivers put out
by the Soviet radio industry from 1947 to 1957 inclusive. A separate
chapter deals with metering and tuning. The present work is a first
attempt to systematize this material. The considerable progress made in
the field during this 11 year period is reviewed. Soviet television sets
are now designed to operate on 12 channels and have rectangular screens
with 35, 43 and 53 cm. diagonals. Among other improvements, television
reception over greater distances has become possible and the cost of
television sets has been reduced. The handbook also contains blueprints

Card 1/12

Manual on Television Receivers

488

for the arrangement of the main receiver parts and chassis plans, oscillogram design data, frequency characteristics and tuning data. Inasmuch as the factories are always improving the design of the television receivers discussed in this book, and as it has not always been possible to register these design changes here, the circuits of several receivers as presented in the text may depart somewhat from the circuits of the models actually being put out. In the chapter on measuring and tuning, only those methods used in practice up to the time of publication are discussed. One section of the handbook gives data on the "Rembrandt" television set imported from East Germany in 1954. The author expresses his thanks to A. M. Kanayeva for reviewing the manuscript, and to M. M. Fayn and E. O. Ovanesbekov for supplying the indispensable technical documentation. There are no references.

AUTHOR: Yel'yashkevich, S. SOV-107-58-8-39/53

TITLE: More on Interlacing (Yeshche raz c cheresstrochnoy razvertke)

PERIODICAL: Radio, 1958, Nr 8, pp 40-42 (USSR)

ABSTRACT: The article deals with the phenomenon of pairing in interlacing. The pair of scanning lines of the two fields merge into one with resultant loss of vertical and horizontal definition. Pairing can be checked by the standard 0249 transmitted test chart or during normal broadcasting. The varying degrees of symmetrical scanning disturbance leading to pairing are illustrated and discussed. To achieve symmetrical raster scanning, both the integrated field pulses must intersect the cut off line at one and the same time, corresponding in one field to the start of the line synchronizing pulse, and in the other leading it by half a line. This unevenness can be counteracted by introducing six equalizing pulses before the field pulse. The line scanning saw-toothed voltage, entering the integrating filter circuit, can disturb the interlaced scanning process. Means by which this can arise are listed. This can be solved via a buffer stage which separates the synchronizing circuits from

Card 1/2

More on Interlacing

SOV-107-58-8-39/53

the line scanning stages. To obtain stable interlacing, alterations should be made in the controls and, if necessary, in the components of the vertical blocking-generator assembly. Some special schemes for improving the interlacing, used in various Soviet TV sets, are given. One employs a special tube for isolating the 6 narrow positive pulses, part of the field signal, and the passing of the remaining signal components. In another, the vertical synchronizer uses an integrating followed by a differentiating circuit which filters off the line pulses and interference. There are 9 sets of diagrams.

Dzhigit, A. M. Kanayeva, E. T. Krenkel', A. A. Kulikovskiy, A. D. Smirnov,
F. I. Tarasov, and V. I. Shamshur.

PURPOSE: This booklet is intended for radio amateurs and for owners of tele-
vision sets.

COVERAGE: The booklet presents in tabular and graphical form information for
checking tubes in 34 types of the most widely-used television sets and de-
scribes various faults occurring in them. Methods of locating faulty tubes
are also described. There are no references. No personalities are mentioned.

Yel'yashkevich, Samuil Abramovich

Spravochnik po televizionnym priyemnikam (Manual on Television Receivers) 2d ed.,
rev. and enl. Moscow, Gosenergoizdat, 1960. 223 p. 150,000 copies printed.

Ed.: Yu.A. Protopopov; Tech. Ed.: K.P. Voronin.

PURPOSE: This manual is intended for technical personnel of television establishments, students in schools of higher technical education, and designers.

COVERAGE: The manual presents characteristics of the more widespread television receivers manufactured by the Soviet radio industry between 1949 and 1959. It contains schematic diagrams, descriptions, information on tuning, electrical and operational characteristics, and data on windings. Separate chapters deal with improvements in television receiver circuits (1957-1958), units and assemblies of general use, and methods of measuring and tuning. The manual is based on plant regulations for tuning and adjustments, information received from television plants, and from the Gosudarstvennyy Soyuznyy radiotrest (State All-Union Radio Trust) of the Ministry of Communications. No personalities are mentioned. There are no references.

YEL YASHKEVICH, Ye.S.

Comparison of the lipolytic activity of sulfate and acetone preparations of rabbit liver. B. I. Gol'dstein and N. S. El'yashkevich. *Biochim. J. (Ukraine)* 18, 559-67 (in Russian, 507-71; in English, 571-4) (1939).—In connection with the work on the relation between the liver lipase and fat in growing rabbits (*C. A.* 33, 7450), J. Needham's method employed with his work on organisms (cf. *C. A.* 28, 2418) was decided upon to dehydrate the tissue without removing the fat. The liver, washed in physiologic soln., and dried with filter paper, was minced with scissors and mixed with 3 times its wt. Na_2SO_4 and placed over CaCl_2 . From 2 to 4 g. of fresh liver equiv. was taken for each expt. The conditions of synthesis varied for different expts., but were the same for acetone-ether (I) and sulfate (II) preps. Controls to det. the possible activating sulfate influence showed no such influence. The synthesis ratio of I to II is 1 to 2.3-8.8 for rabbits 12-45 days old, approaching that of adults. No coeff. could be derived for newborn to 1-2-day-old animals, whose fat-rich liver gave zero synthesis and hydrolysis value for I, but remarkably high II, 6.3-14%. The hydrolytic lipase activity of II of young animals equals that of fresh tissue.

TOPIC TAGS: electric engineering, electric engineering personnel, petroleum engineering personnel, petroleum engineering

ABSTRACT: Brief biography of subject, a doctor of technical sciences and head of Department of Electric Power and Automation in Industry at the Azineftekhim (Azerbaijan Petrochemical Institute), on the occasion of his 60th birthday in October 1964. Graduating from Azerbaijan Polytechnical Institute imeni Azizbekov, subject worked in Caspian shipping industry and later headed the designing division at the Azerbaijan department of Elektroprom. With Azineftekhim since 1927, starting as laboratory assistant; department head since its formation in 1938; deputy dean of power engineering division in 1943-45. One of top Soviet experts on the electric power supply and electrical equipment of the petroleum industry, he has trained many engineers and scientists for this field and is the author of over 60 published works and inventions. Widely known are his works on

TITLE: High-resistivity alloy for tensometers

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 9, 1961, 25, abstract 9I166
("Sb. tr. Tsentr. n.-i. in-t chernoy metallurgii", 1959, no. 22,
183-204)

TEXT: Two alloys are developed which have characteristics close to those of alloys for thermal compensated sensors. The alloy of Fe with 26.63% Cr, 5.55% Al, and 3.48% V [X2610Ф (Kh26YuF)] has a specific resistivity of $1.47 \text{ ohm-mm}^2/\text{m}$; temperature coefficient of linear expansion of this alloy under heating up to 900°C is equal to $13.6 \cdot 10^{-6} \text{ deg}^{-1}$, the temperature coefficient of electric resistivity in the temperature ranges $50 - 400$, $400 - 600$, and $600 - 1,000^\circ\text{C}$ is equal to $(1.3; 0.9; 0.7) \cdot 10^{-5} \text{ deg}^{-1}$ respectively, and may be reduced by heat-treatment. The output signal of the alloy is greater than that of the presently used alloys by a factor of 2 - 3. The alloy containing 76.95% Ni, 20.15% Cr, and 2.52% Al has an electrical resistivity of $1.16 \text{ ohm-mm}^2/\text{m}^*$, temperature coefficient of linear expansion under heating up to 900°C equal to

Card 1/2

A060/A101

High-resistivity alloy for tensometers

$16.6 \cdot 10^{-6} \text{ deg}^{-1}$, while the temperature coefficient of electric resistivity remains constant in the range $50 - 500^\circ\text{C}$ and is equal to $1 - 1.2 \cdot 10^{-5} \text{ deg}^{-1}$. The alloy is not fit for applications above 500°C , since the temperature coefficient of electric resistivity above 500°C becomes negative.

S/776/62/000/025/013/025

AUTHORS: Yelyutin, O.P., Pshechenkova, G.V.

TITLE: Investigation of alloys of the system Ni-Mn-Cr.

SOURCE: Moscow. Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metallurgii. Sbornik trudov. no. 25. Moscow, 1962. Prezisionnye splavy. pp. 189-213.

TEXT: The paper reports the results of an experimental investigation of several alloys of the system Ni-Mn-Cr which exhibit an elevated electrical resistance (ER) and a low temperature coefficient of the ER and which, therefore, are readily utilized for the making of resistor elements which operate in instruments and equipment at near-room T. In addition to the electrical properties of a number of alloys of this system it was found to be necessary, in the interest of the development of suitable manufacturing techniques and related heat treatments, to study the phase composition and the transformation processes therein. The phase diagrams of the systems Mn-Ni and Mn-Ni-Cr are shown. The experimentation comprised a dilatometric analysis, ER measurements, and an investigation of the effects of various elements on the properties of the alloys, an investigation of the effect of heat treatment on the electrical properties of the alloys (performed by I. A. Savost'yanova).

Card 1/3

Investigation of alloys of the system

S/776/62/000/025/013/025

In summary, the test performed in the investigation of alloys of the system Ni-Mn-Cr, containing from 20-45% Mn and 8-10% Cr, permit certain conclusions on the phase composition, transformations, and possible uses of the physical properties of these alloys. The alloy containing 20% Mn and 8% Cr constitutes a single-phase solid solution. During slow heating and cooling in the 400-500°C T interval a K-state forms in the alloy. As the Mn content is increased beyond 23%, an incipient phase transformation of the face-centered γ phase into a face-centered tetragonal ϵ phase was detected dilatometrically; this transformation was distinctly fixed by the X-ray method at a Mn content of 30%. ER measurements during heating denoted a smooth transition from the single-phase to the two-phase alloys which occurs during an increase of the Mn content from 23 to 28%. The alloys lying at the boundary of the two-phase region exhibit a fairly elevated ER(1.4 ohm \cdot mm 2 /m) which increases with increasing Mn content; these alloys have an ER-temperature coefficient varying from positive values to negative values within the T range from room T to 300°. The same properties can be obtained in the two-phase alloy by means of heat treatment that achieves the required solid-solution state in which the new phase does not yet precipitate. The detection of this state is feasible by means of ER measurements and the dilatometric method. An advantage of the alloys obtained from the 2-phase region is the elevated ER. The required state can be obtained by quench or by quench-plus-subsequent-aging, at which the required initial stage of decom-

position of the phase from the solid solution is obtained. The alloying elements contribute to an increase in the ER and an improvement in the mechanical properties of the alloys. There are 20 figures, 1 table, and 4 references (2 Russian-language Soviet, 1 German, 1 English-language).

TITLE: Physical properties of titanium-rich alloys of the titanium-aluminum-tin systemSOURCE: AN SSSR. Izv. Otd. tekhn. nauk. Metallurgiya i gornoye delo, no. 2,
1963, 136-140

TOPIC TAGS: titanium-aluminum-tin system, titanium-rich alloy, titanium-rich-alloy structure, titanium-rich-alloy resistivity, resistivity temperature coefficient, thermal electromotive force, heat conductivity, titanium-rich-alloy strength

ABSTRACT: The physical and mechanical properties of Ti alloys with up to 10% Al and up to 25% Sn have been studied. The alloys were melted in a noncombustible electrode arc furnace in an argon atmosphere, forged into rods at a temperature ranging from 1100-1200 to 700-800°C, annealed in a vacuum of 1×10^{-5} mm Hg at 1200°C for 3 hr, and cooled to room temperature at a rate of 800/sec. After

D

this treatment, all alloys had a single-phase structure of α -solid solutions. Electrical resistivity at 20°C was found to increase steadily with increasing Sn or Al content and reached 1.85 to 1.90 ohm x mm²/m in alloys with 7.5 to 10% Al and 2.5 to 15% Sn. The temperature coefficient of resistivity, while remaining constant for a given alloy in the 20 to 180°C range, decreases linearly with increasing Sn or Al content and is 20×10^{-5} /deg for alloys with 7.5 to 10% Al and 5.0 to 15% Sn. The thermal emf (in couple with Cu), which for pure Ti is +5 mv/deg C, decreases by alloying with Al or Sn, and at 2.5% Sn or 1% Al is negative. A maximum thermal emf of -10 μ v/deg C was shown by ternary alloys with up to 10 to 20% Sn and 5 to 7.5% Al. Both alloying elements decrease heat conductivity from 0.050-0.013 cal/cm x sec x deg for pure Ti to 0.012 cal/cm x sec x deg for alloys containing 22.5% Sn and 2.5% Al. The tensile strength remains almost unaffected on the 78 to 85 kg/mm² level with additions of up to 10 to 12% Sn, but increases to 120 kg/mm² at 17% Sn with elongation dropping to 10%. Al is more effective than Sn in strengthening alloys. Ternary Ti-Sn-Al alloys with 6 to 12% and 4 to 7.5% Al have a maximum

Card 2/3

L 11094-63

tensile strength of 125 kg/mm² and a ductility of 0 to 6%. Further increase in the Sn and Al content lowers both strength and ductility. Orig. art. has: 4 figures.

TOPIC TAGS: niobium, transition element, chromium, cobalt, iron

ABSTRACT: The type of crystal lattice, the temperature dependences of normal resistivity modulus (E) and electrical conductivity (R), the specific electrical resistivity (G), the thermal coefficient of electrical conductivity ($d\rho$), the paramagnetic susceptibility (χ), the absolute thermoelectric force at 20°-100°C, the coefficient of thermal expansion (β) at 20°-900°C, the normal modulus of elasticity (E), the temperature dependence of elasticity modulus (β_E), and the hardness were determined for NbCr₂, NbCo₂, and NbFe₂ samples. The samples were prepared by soaking liquid-phase metals into quartz ampoules 3 mm in diameter. They were subsequently homogenized by holding for 4 hours at 1000°C. The temperature dependence of the normal modulus of

TITLE: Physical and mechanical properties of alloys of the Ti-Nb-Mo system

SOURCE: AN SSSR. Izvestiya. Metally, no. 2, 1966, 125-130

TOPIC TAGS: titanium alloy, niobium alloy, molybdenum alloy, solid mechanical property, solid physical property

ABSTRACT: The concentration dependences of some physical and mechanical properties of alloys in the titanium corner of the Ti-Nb-Mo system were studied on alloys containing up to 50% Nb and 40% Mo. The electrical resistance, its temperature coefficient, thermal conductivity, thermal emf, modulus of normal elasticity, strength, hardness, and plasticity were determined by plotting the corresponding composition vs. property diagrams. Two regions of alloys are distinguished: one with low strength properties and a low plasticity, and one with a high strength and a satisfactory plasticity. The first group of alloys with a strength of 950-1000 N/mm² (97-102 kg/mm²) and a plasticity of 9-14% includes Ti-Nb alloys with 30-35% Nb, Ti-Mo alloys with 10-13% Mo, and intermediate ternary alloys Ti-Nb-Mo. The alloys are located at the boundary of the region of the martensitic transformation. The group

UDC: 669.017.13

of alloys with a satisfactory plasticity includes binary Ti-Nb alloys with 45-55% Nb, binary Ti-Mo alloys with 20-25% Mo, and intermediate ternary alloys Ti-Nb-Mo, located at the boundary of $(\alpha+\beta)$ -phase regions. These alloys have an ultimate strength of 500-900 Mn/m² (51-92 kg/mm²) and an elongation of 15-17%. Orig. art. has 5 figures.

TITLE: Influence of group-IV transition elements and of Cu on the structure and physical properties of alloys based on the compound NiMn

SOURCE: AN SSSR. Doklady, v. 171, no. 2, 1966, 320-323

TOPIC TAGS: nickel alloy, manganese containing alloy, transition element, alloy, phase diagram, resistivity, electric property

ABSTRACT: To investigate the structure and physical properties of alloys of the compound NiMn with transition elements, the authors fused pseudobinary alloys NiMn-Me (Ti, V, Cr, Fe, Co, Cu) containing 1-20 at.% V and Ti, and 1-10 at.% Cr, Fe, Co, Cu. The tests considered of a dilatometric analysis in the 100 -- 950° interval, measurements of the electric resistivity as a function of the alloying-additive content, an electron-microscopic investigation of the structure, and an x-ray phase analysis. The dependence of the electric properties and of the structure of the alloy as a function of the heat treatment was tested in the case of NiMn + 10 at.% V. The tests yielded the phase compositions of the different alloys and the types of crystal
